Use of Registered Pesticides

OVERVIEW

Applicable colleges, departments, researchers, and volunteers must follow the requirements in this section to comply with state and federal laws regarding the use of registered pesticides. Registered pesticides are defined as pesticides that are registered for use with both the U.S. Environmental Protection Agency (EPA) and the Washington State Department of Agriculture (WSDA), or just registered with the WSDA.

This section provides requirements and procedures regarding the following topics:

- Pesticide licenses
- Chemical safety
- Worker protection standards
- Recordkeeping

See Advisory Guidelines for a link to advisory guidelines that supplement this policy.

MASTER GARDENER PROGRAM

Volunteers may not apply anything other than home-and-garden pesticides to WSU property. Coordinators who oversee Master Gardener (MG) gardens on WSU lands work with the local Research and Extension Center directors for access to licensed personnel who apply pesticides on their behalf.

NOTE: All posting requirements must be met. Careful scheduling of applications to gardens with public access must be a priority.

Coordinators who oversee MG gardens in city or county parks are highly encouraged to have written agreements with city or county park agencies. If WSU applies pesticides to an MG garden, the agreement should provide that WSU is to maintain the area and that WSU is in control and possession of the demonstration garden for the purpose of such maintenance. The MGs may then be able to apply general use pesticides using non-powered equipment. The agreement should also provide that the city or county agency is responsible for applying pesticides if those pesticides are not general use pesticides or if powered equipment is to be used for the application.

PESTICIDE LICENSE REQUIREMENTS

The University encourages any employee who advises on or works with pesticides to obtain and maintain a pesticide license in order to demonstrate his or her level of professional competency.
Use of Registered Pesticides

PESTICIDE LICENSE REQUIREMENTS (cont.) Personnel must obtain valid WSDA pesticide licenses prior to conducting the following types of work in the state of Washington:

- Work activities that fall under the WSDA requirements for a public consultant or public operator (see WAC 16-228).
- Application of restricted-use pesticides (RUP).
- Application of use-restricted pesticides (URP).
- Application of general use pesticide products through powered equipment.

See RCW 17.21.020 and WAC 16.228.1010 for definitions.

If personnel are not licensed, a licensed public operator must be within eyeshot and earshot and supervise the application at all times.

The University expects personnel applying pesticides to field plots in other states to obtain all necessary licenses or permits required by such states in advance of the applications.

Applicability The pesticide licensing requirements apply to those who engage in the work activities listed under Overview at locations including, but not limited to, all demonstration gardens (e.g., Discovery Gardens), research plots, greenhouses, and general grounds and farm maintenance at any WSU location. Licenses are also required for application of restricted-use pesticides (RUP) or use-restricted pesticides (URP) on cooperator lands. (See BPPM 45.65 for definition of cooperator lands.)

References Supervisors and unit heads must verify that appropriate licenses are held by subordinates in their respective areas. The WSDA maintains a licensing search website which allows users to verify that a license has been issued to any particular individual or business. To access the WSDA Licensing Search website, go to:

http://agr.wa.gov/pestfert/licensinged/search/default.aspx

Alternatively, supervisors and unit heads may contact the Pesticide Coordinator for assistance.
Use of Registered Pesticides

Public Operator

Faculty, staff, and students must have public operator licenses with appropriate endorsement categories for the applicable specific work areas in order to apply the following types of pesticides:

- Restricted-use pesticides (RUP)
- Use-restricted pesticides (URP)
- General use pesticides through powered equipment

See RCW 17.21.220 and WAC 16-228-1545.

Faculty, staff and students must pass appropriate exams in order to obtain license endorsements.

A public operator license with appropriate endorsements allows the user to work in the following capacities:

- Applicator
- Supervisor for unlicensed personnel
- Public consultant

Personnel who carry public operator licenses do not need to carry both public operator and public consultant licenses.

A licensed public operator may supervise unlicensed personnel only when he or she is physically present at the work site and in constant eye and ear contact during the application.

NOTE: Research faculty who apply general use pesticides through powered equipment only to their research plots are exempt from the public operator license requirement.

Public Consultant

Faculty, staff, and students who, as WSU representatives, recommend the use of non-home-and-garden pesticides must have public consultant licenses with appropriate endorsement categories for the specific areas in which they work. Faculty, staff and students must pass appropriate exams to obtain license endorsements. See RCW 17.21.220 and WAC 16-228-1545.

NOTE: A consultant license does not allow the individual to apply pesticides or supervise the use of pesticides by another person. A researcher who gives use instructions to a licensed technician must have an operator license, not a consultant license.

The University advises individuals working with plant growth regulators to obtain license endorsements in either the agricultural weed or the ornamental weed categories.
Use of Registered Pesticides

CHEMICAL SAFETY

Each unit is responsible for creating and maintaining safe and healthy work environments. The University's Environmental Health and Safety (EH&S) department provides technical assistance to units on a variety of workplace safety topics, including chemical safety.

Cholinesterase Monitoring

Supervisors of pesticide handlers who use toxicity class I or II organophosphate or N-methyl-carbamate pesticides must contact EH&S for assistance in complying with state cholinesterase monitoring requirements.

NOTE: Medical monitoring is also referred to in state rules and University policies as medical surveillance.

Further details regarding the state rules are available on the Washington State Department of Labor and Industries (L&I) Cholinesterase Monitoring website at:

www.lni.wa.gov/Safety/Topics/AtoZ/Cholinesterase/default.asp

Related Safety Resources

In addition to applicable sections in the Safety Policies and Procedures Manual (SPPM), EH&S provides advisory fact sheets regarding the following subjects:

- Restricted entry
- Hazard communication (see also SPPM 5.10 and 4.12);
- Heat-related illness (see also SPPM 3.44)
- Respirator fit (see also SPPM 3.24)
- Other related topics

The advisory fact sheets are available in HTML and PDF versions on the EH&S Factsheets website at:

eh.s.wsu.edu/training/EHS-Factsheets.html

Chemical safety information is also available from the L&I website at:

www.lni.wa.gov/Safety/default.asp

WORKER PROTECTION STANDARDS

The federal government enacted the Worker Protection Standards (WPS) (40 CFR 170) to protect workers (faculty, staff, and volunteers) from occupational exposure to agricultural pesticides. Both WSDA and L&I conduct compliance audits for WPS.
Use of Registered Pesticides

**WORKER PROTECTION STANDARDS (cont.)**

The key feature of this legislation is that use of any pesticide that carries an *Agricultural Use Requirement* section on the label requires compliance with the WPS. Such labeling is also referred to as WPS labeling. For purposes of the WPS, the University is viewed as an agricultural establishment growing agricultural plants if any unit, college, or farm uses a pesticide product that carries the WPS/Agricultural Use Requirement labeling.

Under WPS, employees are divided into the two following categories:

- **Pesticide Handlers.** A pesticide handler is defined as anyone who mixes, loads, or applies pesticide, or who cleans and repairs pesticide application equipment.

- **Pesticide Workers.** A pesticide worker is defined as anyone who works in plant production (e.g., watering, irrigating, pruning) in an area where a pesticide application was made *within the last 30 days* using a product containing WPS labeling.

Educational facilities are clearly covered in WPS interpretive guidelines. Although WPS compliance is not required when employees perform landscape maintenance duties, or when researchers use unregistered pesticides (i.e., numbered compounds), supervisors must promote safe work environments in all cases. (NOTE: Other L&I standards cover employees performing landscape maintenance. See WAC 296-62.)

**Summary of Worker Protection Requirements**

Additional WPS information is available on the WSDA Worker Protection website at:

agr.wa.gov/PestFert/Pesticides/WorkerProtection.aspx

**Protection During Applications**

Applicators are prohibited from applying pesticides in ways that expose workers or other persons. Workers must be excluded from areas while pesticides are being applied.

**Restricted-Entry Intervals**

Restricted-entry intervals must be specified on all agricultural plant pesticide product labels. Workers are excluded from entering a pesticide-treated area during the restricted entry interval, with few narrow exceptions. There is a no-entry period for workers of four hours after application for all products with WPS labeling; this means *no* early entry, unless the workers are wearing personal protective equipment (PPE).
Use of Registered Pesticides

**Personal Protective Equipment**  
Units must provide and maintain PPE for handlers and early-entry workers. The PPE must meet label requirements.

**NOTE:** Employees wearing respirators, including N95s (particulate-filtering facepiece respirators), must comply with the requirements of the University's respiratory protection program (**SPPM 3.24**). The respiratory protection program requirements include medical clearance, fit-testing, and training. Supervisors may contact EH&S to determine if unit employees need to be included in the respiratory protection program.

**Notification of Workers**  
Units must notify workers about treated areas in order to avoid inadvertent exposures.

**Decontamination Supplies**  
Units must provide access to the following decontamination supplies for personnel who may be exposed to pesticides.

**All Employees**  
Units must provide water, soap, and single-use towels in quantities sufficient to meet the needs of all employees. Units must ensure that the quality and temperature of any water available to workers will not cause illness or injury upon contact with skin or eyes or if swallowed. Decontamination supplies must be:

- Located together.
- Reasonably accessible.
- Not more than one-quarter mile from work location.

**Workers**  
Units must provide adequate water for routine washing and emergency eye flushing for all pesticide workers. (See **SPPM 5.15.**)

**Handlers**  
Units must provide adequate water for all pesticide handlers to allow for the following:

- Routine washing.
- Emergency eye flushing.
- Washing the entire body in case of an emergency.

Units must provide at least ten gallons of water for one employee and twenty gallons of water for two or more employees at mixing and loading sites that do not have running water. (See also **SPPM 5.15.**
Use of Registered Pesticides

Emergency Assistance

Units must make transportation to a medical care facility available to any worker or handler who may have been poisoned or injured.

Units must provide information to the employee and the medical attendant regarding the pesticide to which the employee may have been exposed.

Pesticide Safety Posters

Units with personnel who use or may be exposed to pesticides are required to display a pesticide safety poster. Pesticide safety posters are available for purchase from the website of the EPA Pesticide Programs' official vendor, Gempler's, at:

www.gemplers.com

Pesticide Safety Training

Units must ensure that all pesticide workers and handlers complete pesticide safety training. Supervisors are responsible for providing and documenting the training.

Training for Workers

Pesticide safety training for workers must include, at a minimum, the following information:

- Where and in what form pesticides may be encountered during work activities.
- Hazards of pesticides resulting from toxicity and exposure, including acute and chronic effects, delayed effects, and sensitization (MSDSs must be provided; see SPPM 5.10).
- Routes through which pesticides can enter the body.
- Signs and symptoms of common types of pesticide poisoning.
- Emergency first aid for pesticide injuries or poisonings.
- How to obtain emergency medical care.
- Routine and emergency decontamination procedures, including emergency eye flushing techniques.
- Hazards from chemigation (i.e., application of pesticides through irrigation) and drift.
- Hazards from pesticide residues on clothing.
- Warnings about taking pesticides or pesticide containers home.

(WAC 296-307-12040)
Use of Registered Pesticides

_Pesticide safety training for handlers must include, at a minimum, the following information:_

- Format and meaning of information contained on pesticide labels and in labeling, including safety information such as precautionary statements about human health hazards.

- Hazards of pesticides resulting from toxicity and exposure, including acute and chronic effects, delayed effects, and sensitization.

- Routes through which pesticides can enter the body.

- Signs and symptoms of common types of pesticide poisoning.

- Emergency first aid for pesticide injuries or poisonings.

- How to obtain emergency medical care.

- Routine and emergency decontamination procedures, including emergency eye flushing techniques.

- Need for and appropriate use of personal protective equipment;

- Prevention, recognition, and first aid treatment of heat-related illness.

- Safety requirements for handling, transporting, storing, and disposing of pesticides, including general procedures for spill cleanup.

- Environmental concerns such as drift, runoff, and wildlife hazards.

- Warnings about taking pesticides or pesticide containers home.

(WAC 296-307-13025)

**Access to Labeling and Site Specific Information**

Units must inform handlers and workers of pesticide label requirements. Units must post information regarding recent pesticide applications (within the last 30 days) in central locations.

**RECORDKEEPING REQUIREMENTS**

This section (45.69) gives instructions for recordkeeping following application of registered pesticides for registered uses. See _BPPM 45.70_ for a description of recordkeeping requirements following application of unregistered pesticides or registered pesticides used in an experimental manner.
Use of Registered Pesticides

RECORDKEEPING REQUIREMENTS (cont.) All licensed applicators who apply pesticides at any location, and all persons applying pesticides to more than one acre of agricultural land in a calendar year, must keep records of such applications.

Registered pesticide application records must be:

- Completed on the same day that the pesticide is applied.
- Submitted to the WSDA when requested.
- Retained for seven years from the application date (see BPPM 90.01).
- Maintained in individual unit or local land use committee files.
- Provided for inspection upon request.

See BPPM 90.01 for further information regarding University records retention requirements.

Recordkeeping Forms Personnel may either use appropriate WSDA recordkeeping forms or may design a custom form using the required elements and submit it to WSDA for advance approval. The unit or committee retains the WSDA’s approval letter with the application records. WSDA recordkeeping forms are available from the WSDA Compliance Activities website at:

agr.wa.gov/pestfert/Pesticides/ComplianceActivities.aspx#ApplicRecForms

Refer to RCW 17.21.100 for a list of the required report elements.

The advantage of designing a form is that it allows the researchers to customize the form to fit with existing experimental design records or clientele reporting requirements.

ADVISORY GUIDELINES Several advisory guidelines supplement the policy information. The advisory guidelines are available on the WSU Employee Resources section of the Washington State Pest Management Resources website at:

ext100.wsu.edu/wsprs/employees/

The advisory guidelines include, but are not limited to:

- Contacts (for questions and assistance)
- Information for WSU Employees Working in Oregon and Idaho Test Plots
- Frequently Asked Questions (FAQs) about Pesticide Uses
